## Experiences of training

in communicating the hydro-geological risk

Martinengo, M., Rosatti, G, Fraccarollo, L. and Rigon, R.
The CUDAM crew

Who does not do, makes no mistake?
They can do the bigger mistake!

### Giving people basic information about:

- phenomena and risk mapping.
- how the risk events are managed (hazard mapping and planning);
- what happens during events (emergency planning and major experiences);
- what law says and the judge decides

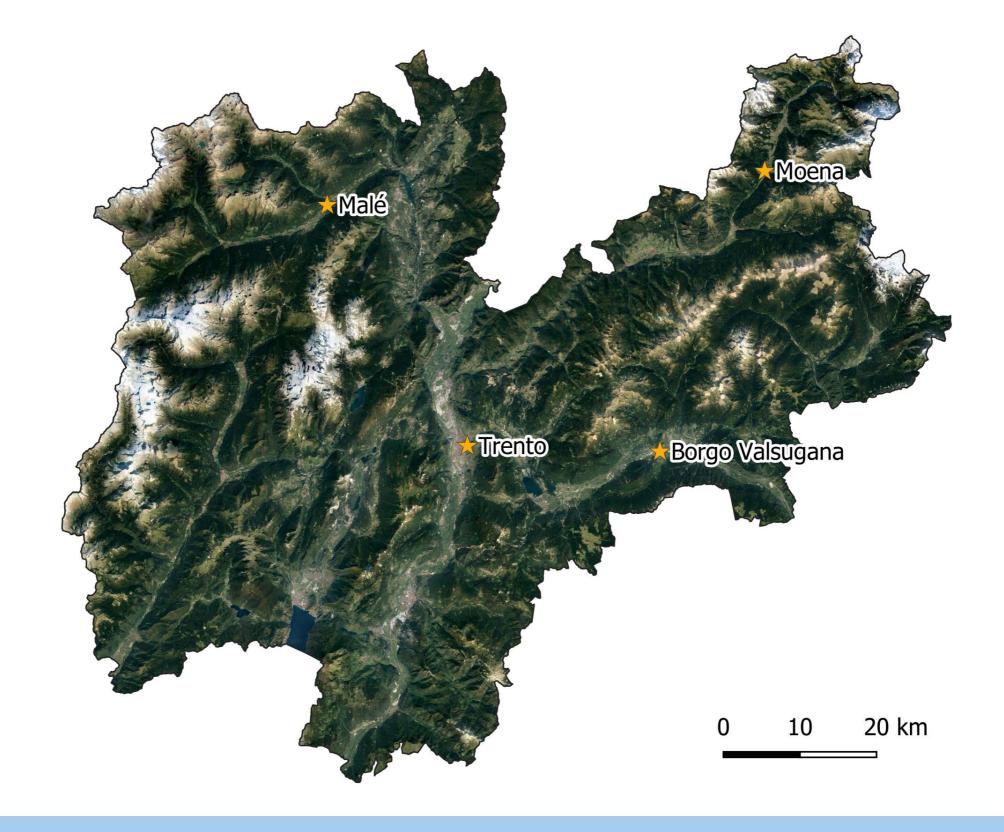

### Helping communication about emergencies and risks

- · Bringing to people knowledge about the LIFE FRANCA portal;
- · Description of the **strategic scenarios**.

## Field Trip in collaboration with the Autonomous Province of Trento - Servizio Bacini Montani

	Number	%
Practitioner	117	86.03%
Policy-maker	12	8.82%
Citizen	5	3.68%
Journalist	2	1.47%

### **Partecipant**

In general, the courses have attracted mainly technicians and some administrators. In all editions it was difficult to involve journalists (for whom DICAM / CUDAM participated to the specific activity organized by the MUSE). There was a highly participation, of course, after the events of October 2018 that reawakened people attention as in other occasion in the past.

I

To reach as many participants as possible, **training credits from professional orders** / colleges have been requested in the most recent editions. This has increased the number of participants, otherwise reluctant to participate.

A note about politicians: when they are elected they are mostly unaware of the responsibilities they have about risk management.

This actually can bring them quite an amount of stress when revealed. A lot of work of information has to be done with respect to this.

We did not get many "lay people" in our events.

# IV

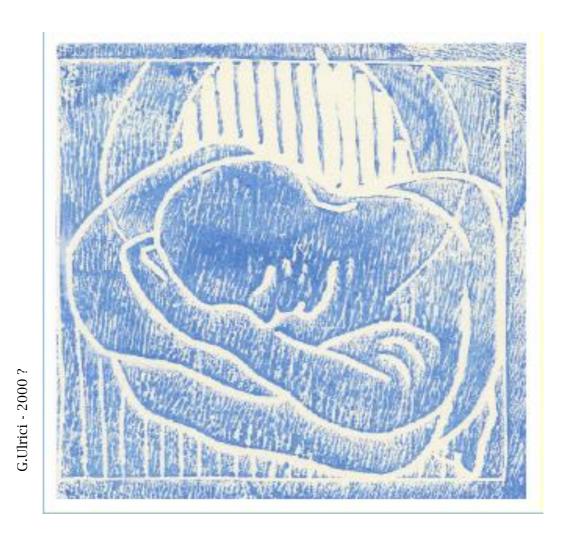

Our opinion: missing proper information about phenomena causes troubles! Journalists give biased information, lawyers misunderstand what happened, people do not care until it is too late.

There is a long and winding road to achieve proper information goals and ourselves changed our point of view during these experiences

# GEOframe Winter School 2020 - It is time to apply!

The second edition on the Winter School on GEOframe will be held between January 8 and 17, 2020 in Trento, Italy. The course is devoted to Ph.D. Students, Post-docs, Young researchers (and Professionals!) interested in estimating all the components of the hydrological cycle (rainfall, evapotranspiration, snow-melting, and river discharge). The system they will learn allows to work out very small catchments and continental basins as well (e.g. Abera et al., 2017a,b) up to build operational solutions as the one used in in Basilicata.

The aim of the course is to enable participants to run their own simulations and eventually on their own catchments and estimate the hydrological budget components.

With respect to the 2019 Winter School, there will be more practice and more detailed work on evapotranspiration and rainfall-runoff. It will be much more focused on exercises and on getting the water budget performed under various hypotheses on models' structure.
